PROJECT PROPOSAL

Introduction

In today's rapidly developing technological environment, manual hotel management processes have become outdated and often cause delays, errors, and difficulties in maintaining accurate records. To address these challenges, hotels require a digital system that can securely store information and support daily management tasks. The proposed Hotel Management System is designed to keep well organized data related to rooms, customers, and suppliers through a structured database accessible only to the management team. By replacing manual record keeping, this system helps improve accuracy, strengthen data handling, and provide a more efficient and reliable experience for the management team, customers, and suppliers.

Problem Statement

This project aims to develop a web based database-driven Hotel Management System to replace the hotel's current manual billing and record keeping methods.

The hotel currently face issues such as:

- Double bookings
- Slow Check-ins
- Missing records
- Wrong billing
- Poor store management
- Supplier delays
- Inefficient overall workflow

These problems occur because there is no real-time, centralized system to manage hotel activities. Therefore, this may automate reservations, room management, billing, orders, and store/supplier operations. This integrated system will reduce errors, improve service quality, enhance decision-making, and increase overall hotel efficiency.

Objectives

The objective of this project is to develop a real-time hotel management system that replaces manual processes with a more accurate and efficient digital solution. It aims to centralize room, customer, and supplier information, minimize errors, prevent booking conflicts, and speed up hotel operations. By improving data management and workflow coordination, the system is expected to support better decision-making, streamline daily tasks, and create a more reliable and organized hotel environment.

Features and functionalities

1. For Customers

- **Room Booking:** Customers can enter personal details and book available rooms.
- **Auto-Generated Codes:** System generates a unique *Customer ID* and *Room ID* after booking.
- **Food Ordering:** Customers can order meals directly using their Room ID.
- **Billing:** Customers receive a complete bill during checkout.

2. For Suppliers

- **Supplier Login:** Access the supplier interface to record deliveries.
- **Stock Updates:** Suppliers can enter delivered items and quantities to update inventory.

3. For Hotel Management

- **Admin Login:** Secure password-based access.
- **Customer Management:** View, edit, and manage customer details.
- **Room Management:** Check availability, update booking status.
- **Manage Stock:** View and edit inventory details submitted by suppliers.

Expected outcomes

- Efficient room booking process
- Automated code generation
- Integrated Food ordering system
- Accurate Billing System
- Supplier management
- Real time Inventory Updates
- Centralized hotel management dashboard
- Improved data accuracy and record keeping

Limitations

- Limited online payment support.
- Limited food ordering options.
- System depends on internet availability.
- No advanced analytics.
